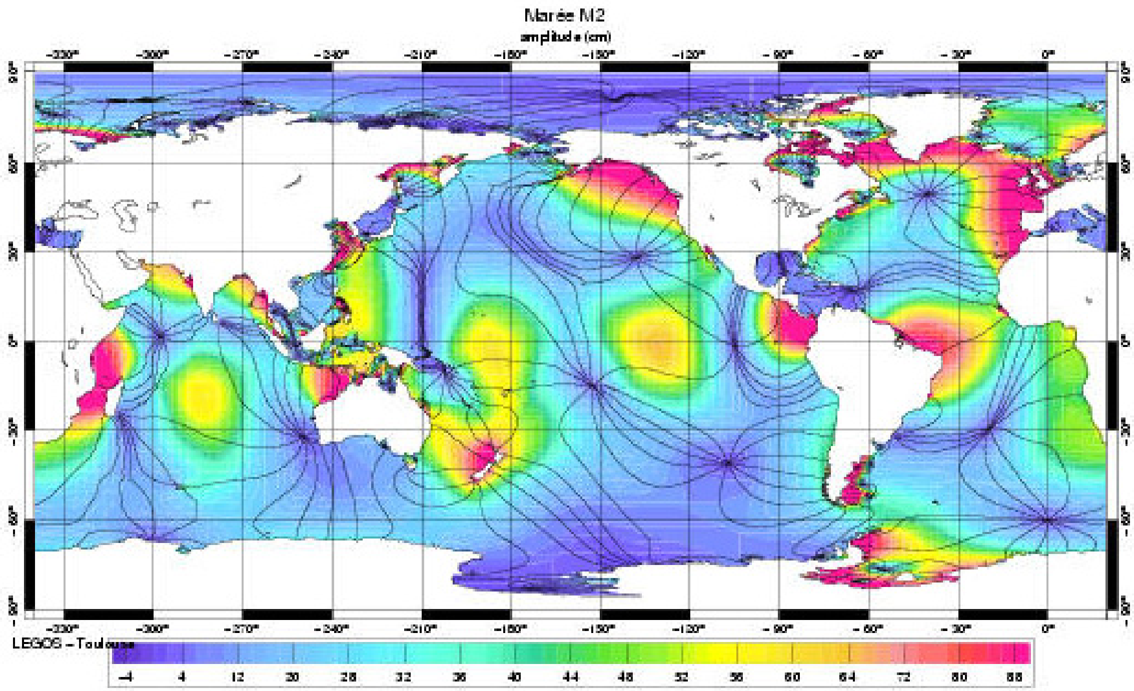
Ocean and atmospheric tides standards (used for EIGEN gravity field modeling)

Richard Biancale (CNES/GRGS)



IERS Workshop on Conventions: 20-21 September 2007

Ocean tides modeling

The height of ocean tides is expressed by a sum over n waves :

$$\xi(\varphi\lambda t)=\sum_n Z_n(\varphi\lambda)\cos\left(\theta_n(t)-\psi_n(\varphi\lambda)\right)$$

Z_n is the amplitude of the wave *n*,

ψ_n is the phase

θ_n is the Doodson argument which is expressed in linear combination of 6 variables :

$$\theta_n(t)=n_1\tau+(n_2-5)s+(n_3-5)h+(n_4-5)p+(n_5-5)N'+(n_6-5)p_s$$

These 6 variables with decreasing frequencies represent the fundamental arguments according to the Sun and Moon motions :

τ : *angle of the mean lunar day (1.03505 d)*
s : *angle of the mean tropic month (27.32158 d)*
h : *angle of the mean tropic year (365.2422 d)*
p : *angle of the mean lunar perigee (8.8473 y)*
N' : *angle of the mean lunar node (18.6129 y)*
p_s : *angle of the perihelion (20940.28 y)*

n_1 (= 0, 1, 2, 3...) defines the specie (long period, diurnal, semi-diurnal, ter-diurnal...), n_2 the group (in general :$1 \leq n_2 \leq 9$) and n_3 the constituent ($1 \leq n_3 \leq 9$).

The amplitude (Z_n) and phase (ψ_n) of the different waves of tides represented by **cotidal maps** can be expanded in spherical harmonic functions of $Z_n \cos\psi_n$ and $Z_n \sin\psi_n$:

$$\begin{cases} Z_n \cos\psi_n = \sum_l \sum_m \left(a_{n,lm} \cos m\lambda + b_{n,lm} \sin m\lambda\right) P_{lm}(\sin\varphi) \\ Z_n \sin\psi_n = \sum_l \sum_m \left(c_{n,lm} \cos m\lambda + d_{n,lm} \sin m\lambda\right) P_{lm}(\sin\varphi) \end{cases}$$

Then we have : $\xi(\varphi,\lambda,t) = \sum_n \left(Z_n \cos\psi_n \cos\theta_n + Z_n \sin\psi_n \sin\theta_n\right)$

$$= \sum_n \sum_l \sum_m \left[\begin{array}{l} \frac{a_{n,lm} - d_{n,lm}}{2}\left(cos\, m\lambda\, cos\,\theta_n - sin\, m\lambda\, sin\,\theta_n\right) \\ + \frac{a_{n,lm} + d_{n,lm}}{2}\left(cos\, m\lambda\, cos\,\theta_n + sin\, m\lambda\, sin\,\theta_n\right) \\ + \frac{c_{n,lm} + b_{n,lm}}{2}\left(cos\, m\lambda\, sin\,\theta_n + sin\, m\lambda\, cos\,\theta_n\right) \\ + \frac{c_{n,lm} - b_{n,lm}}{2}\left(cos\, m\lambda\, sin\,\theta_n - sin\, m\lambda\, cos\,\theta_n\right) \end{array} \right] P_{lm}(sin\,\varphi)$$

Writing :

$$C^+_{n,lm} = \frac{a_{n,lm} - d_{n,lm}}{2} \quad , \quad C^-_{n,lm} = \frac{a_{n,lm} + d_{n,lm}}{2} \qquad and \qquad S^+_{n,lm} = \frac{c_{n,lm} + b_{n,lm}}{2} \quad , \quad S^-_{n,lm} = \frac{c_{n,lm} - b_{n,lm}}{2} \quad ,$$

the **height of tide** becomes : $\boxed{\xi(\varphi,\lambda,t) = \sum_n \sum_l \sum_m P_{lm}(sin\,\varphi) \sum_{+}^{-} \left[C^{\pm}_{n,lm}\, cos\left(\theta_n + \chi_n \pm m\lambda\right) + S^{\pm}_{n,lm}\, sin\left(\theta + \chi_n \pm m\lambda\right)\right]}$

Procedure

reading the point grid by *lec_grille(_quart)_degre*

converting by *gpgm2*; point grid C → mean grid C

converting by *analhs*; mean grid C → a_{lm}, b_{lm} harmonics

converting by *gpgm2*; point grid S → mean grid S

converting by *analhs*; mean grid S → c_{lm}, d_{lm} harmonics

converting by *convers_hs*; $(a_{lm}, d_{lm})/(b_{lm}, c_{lm})$ harmonics → $C_{lm}^{\pm}$ / $S_{lm}^{\pm}$ ocean tides harmonics

applying by *cor_ellips* the ellipsoidal correction

Principales composantes extraites du développement de Doodson (source : thèse F. Lefèvre)

Admittance function

The **admittance function** is defined for each wave as the **ratio between the potential generating tides and the ocean response** :

$$G_n(\varphi,\lambda)=\frac{\xi_n(\varphi,\lambda,t)}{U_n(\varphi,\lambda,t)} \quad \text{with} \quad U_n = gH_nY_2^{n_1}(\varphi,\lambda)\begin{bmatrix} 1 \\ -i \end{bmatrix}_{n_1 odd}^{n_1 even} e^{i\theta_n}$$

The behavior of the admittance function is smooth in frequency so that it can be interpolated linearly between 2 main waves of close frequencies $\left(\dot{\theta}_1 \text{ and } \dot{\theta}_2\right)$:

$$G(\dot{\theta}_n)=\frac{\dot{\theta}_n-\dot{\theta}_1}{\dot{\theta}_2-\dot{\theta}_1}G(\dot{\theta}_2)-\frac{\dot{\theta}_n-\dot{\theta}_2}{\dot{\theta}_2-\dot{\theta}_1}G(\dot{\theta}_1) \quad \text{with} \quad G(\dot{\theta}_1)=\frac{\xi_1}{U_1} \quad , \quad G(\dot{\theta}_2)=\frac{\xi_2}{U_2}$$

$$\xi_n=G(\dot{\theta}_n)U_n=\frac{\dot{\theta}_n-\dot{\theta}_1}{\dot{\theta}_2-\dot{\theta}_1}\frac{U_n}{U_2}\xi_2-\frac{\dot{\theta}_n-\dot{\theta}_2}{\dot{\theta}_2-\dot{\theta}_1}\frac{U_n}{U_1}\xi_1$$

O. Colombo, thesis of S Casotto, (1989)

$$\boxed{\begin{aligned}\xi_n = \frac{\dot{\theta}_n-\dot{\theta}_1}{\dot{\theta}_2-\dot{\theta}_1}\cdot\frac{H_n}{H_2}\Big\{ & cos(\theta_n-\theta_2)\sum_{\ell,m}P_{lm}(sin\varphi)\sum_{+}^{-}\left[C_{\ell m}^{\pm}cos(\theta_2+\chi_2\pm m\lambda)+S_{\ell m}^{\pm}sin(\theta_2+\chi_2\pm m\lambda)\right] \\ & +sin(\theta_n-\theta_2)\sum_{\ell,m}P_{lm}(sin\varphi)\sum_{+}^{-}\left[S_{\ell m}^{\pm}cos(\theta_2+\chi_2\pm m\lambda)-C_{\ell m}^{\pm}sin(\theta_2+\chi_2\pm m\lambda)\right]\Big\} \\ +\frac{\dot{\theta}_2-\dot{\theta}_n}{\dot{\theta}_2-\dot{\theta}_1}\cdot\frac{H_n}{H_1}\Big\{ & cos(\theta_n-\theta_1)\sum_{\ell,m}P_{lm}(sin\varphi)\sum_{+}^{-}\left[C_{\ell m}^{\pm}cos(\theta_1+\chi_1\pm m\lambda)+S_{\ell m}^{\pm}sin(\theta_1+\chi_1\pm m\lambda)\right] \\ & +sin(\theta_n-\theta_1)\sum_{\ell,m}P_{lm}(sin\varphi)\sum_{+}^{-}\left[S_{\ell m}^{\pm}cos(\theta_1+\chi_1\pm m\lambda)-C_{\ell m}^{\pm}sin(\theta_1+\chi_1\pm m\lambda)\right]\Big\}\end{aligned}}$$
